ISO

ISO allows you to digitally brighten or darken a photo. This works the same way film speed does. The higher the number, the brighter your photo will be. As you increase the ISO, you'll create more digital noise.

ISO 100-200

FOR: Full sun, no shade, images with tripods

Use when you have the brightest possible scene.

ISO 200-400

FOR: Cloudy days, shade, window light

Use when the sun isn't directly hitting your subject.

ISO 400-800

FOR: Sunrise/ Sunset (Golden Hour)

Use in the hour before sunset and after sunrise.

ISO 800-1600

FOR: Indoors without a flash

Use when photographing indoor scenes.

ISO 1600-3200

FOR: Indoors at night (concerts)

Use in low light conditions.

ISO 3200+

FOR: Extra low light (stars)

Use for scenes with very low light, where most of the scene is dark.
