DYNAMIC TENSION

Dynamic tension is a way of using the energy and movement available in various features of the frame to draw the eye out of the picture. This happens in contrasting directions, or due to contrasting colors.

Converging Lines/Strong Focal Point

Converging lines bring you to the center of the frame where the lines meet. You are led out by other converging lines.

Leading Lines

When you combine multiple leading lines that lead to the same subject, you can cause dynamic tension. Rather than one clear path for your eyes to follow, they are exploring multiple routes.

Contrasting Lines

Lines with no clear direction, and no single converging point of interest, can provide the strongest dynamic tension.
