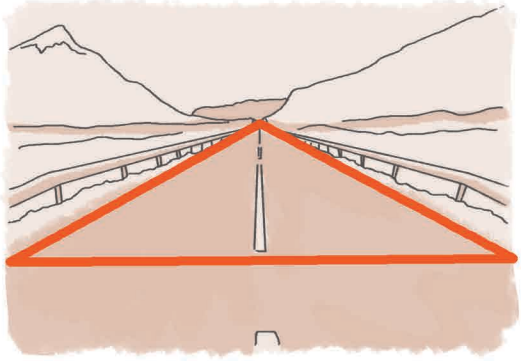
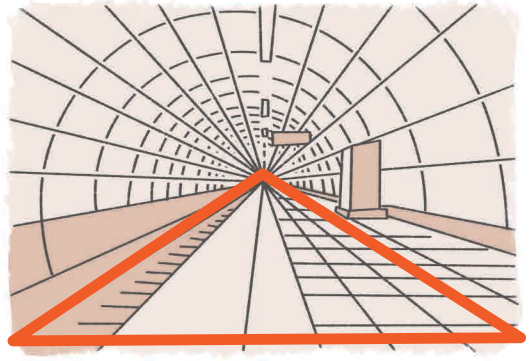
TRIANGLES

Converging Triangle

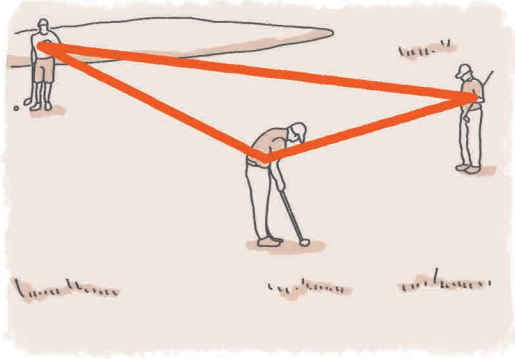


If lines extend far enough into the distance, they create a converging triangle. They usually fall outside the frame.



Think of roads or train lines that disappear in front of you. These are often only two lines. The bottom of your frame makes up the third.

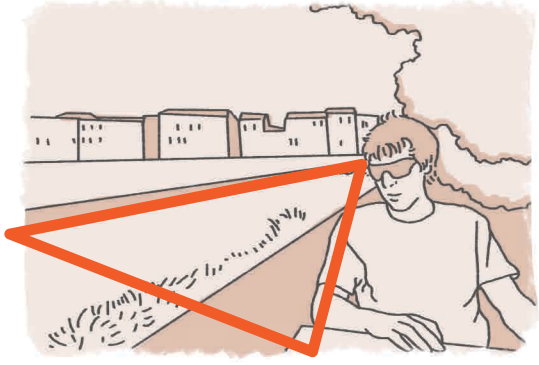
Implied Triangle



Triangles are a rare sight in the natural world. We need to imply the existence of a triangle even when we can't physically see it.

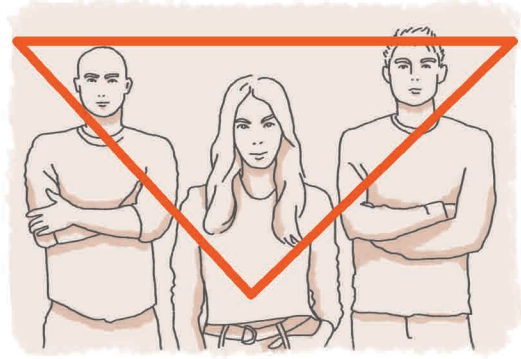
This can be through the placement of elements in a frame, forming either a triangle or pyramid shape.

Focus Attention



Triangles, like arrows, converge at a single point, drawing your eyes down their edges and onto the subject.

Three Figure Shot



Three subjects in a frame equal a triangle. No matter where they are placed, drawing a line between them creates a powerful shape.
