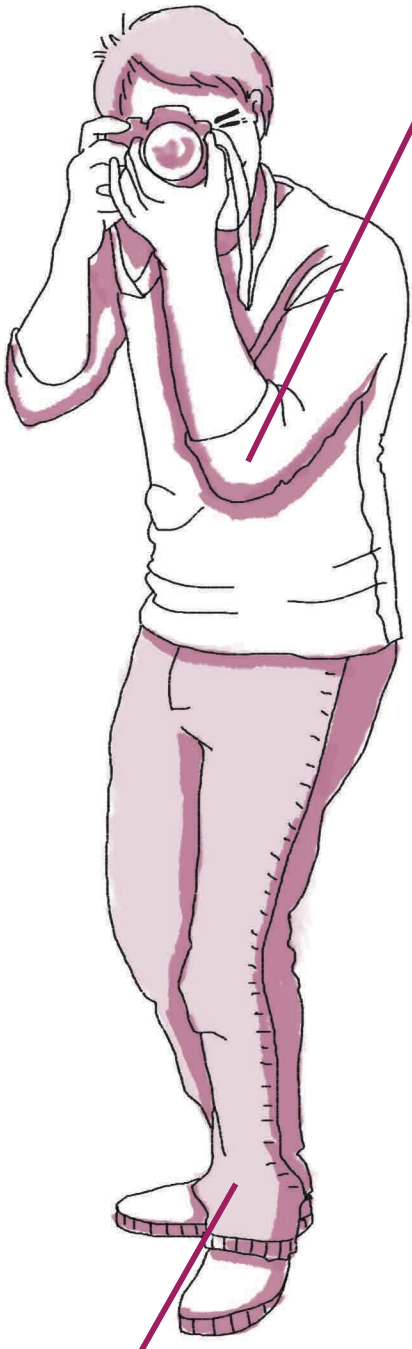
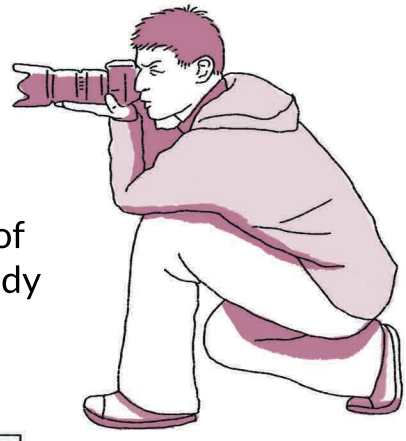
HOW TO HOLD THE CAMERA



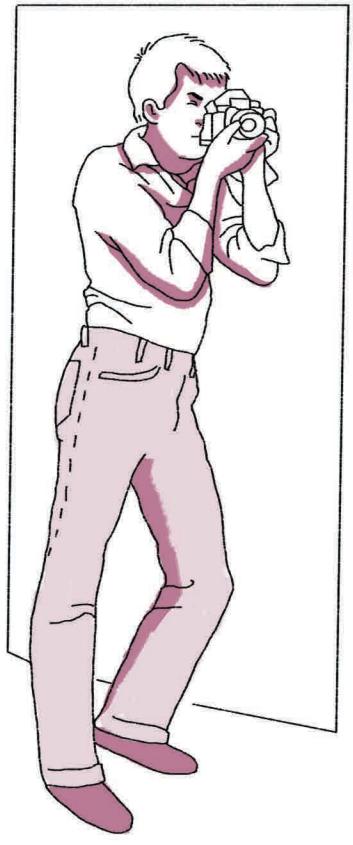
Elbows

Tuck your elbows into your body to keep your camera steady.



Kneeling

Keep your center of gravity low to steady yourself.



Leaning In

Use a wall or flat surface to ensure stability. This is useful when you need a slow shutter speed but don't have a tripod or aren't allowed to use one.

Legs

Keep your legs a little apart, so that you have maximum balance.

Hands

The left hand should grip the camera with the forefinger towards the end of the lens. This prevents the little finger from obscuring the view.

PREPARING TO SHOOT
